BOOST YOUR ORAL HEALTH WITH FLUORIDE

What Is Fluoride?

Fluoride is a mineral that helps prevent cavities.

How Can It Help?

Fluoride is key to good oral health! Not only can it help prevent cavities, but it also can repair teeth when a cavity is just starting to form.⁴ Dentists have used fluoride treatments for decades to help protect their patients' oral health!

Enamelast fluoride varnish is a professional fluoride treatment that delivers fluoride directly onto your teeth. Plus, it tastes great!³

PROTECT TEETH WITH DENTAL SEALANTS

What Are Sealants?

A dental sealant is a thin, protective coating applied to the grooves of your teeth.

How Do They Help?

Sealants are placed in the pits and grooves of teeth to keep food, bacteria, and acid from settling on your enamel.
