

Applying sealants to your child's teeth is a quick, effective, and painless way to reduce the likelihood of cavities. And applying sealants is often less expensive than treating cavities.

ALWAYS BPA FREE

"Ultradent has for many years been aware of the risks associated with BPA, and we are passionate about ensuring our dental sealants are BPA free. We even hired an independent third-party laboratory to test for BPA in our sealants. Using the most sophisticated analytical equipment and processes, they couldn't even find a trace amount. At Ultradent, we've never used ingredients that contain BPA in our dental sealants, UltraSeal XT plus and UltraSeal XT hydro. And we never will."

cavity-causing bacteria

DENTAL SEALANTS PROTECT YOUR KIDS

from things you can't see

UltraSeal XT[®] plus[™] UltraSeal XT[®] hydro[™]

BRUSHING AND FLOSSING AREN'T ALWAYS ENOUGH

Brushing and flossing are the most important things your child can do at home to prevent cavities. But brushing and flossing alone aren't always enough.

That's because the tiny grooves (called pits and fissures) on the biting surfaces of your child's teeth can be smaller than the toothbrush bristles they use to brush their teeth, so the brush can't effectively clean the entire tooth.

Photo magnified 50x shows toothbrush bristles are too large to fit inside pits and fissures.

UltraSeal XT® dental sealants are made to flow into the small pits and fissures of your child's teeth. Your dental professional applies the sealant with a special brush made with bristles small enough to fit inside those pits and fissures to help ensure the sealant gets inside and seals them up. Once inside, the sealant releases fluoride to strengthen the enamel.

Photo magnified 50x shows the bristles of the special applicator brush used to place UltraSeal XT sealants are small enough to fit inside pits and fissures.

WHAT ARE SEALANTS AND HOW DO THEY WORK?

A sealant is a resin material usually applied to the chewing surfaces of the back teeth. It acts as a barrier that prevents bacterial plaque from entering the teeth's pits and fissures. It also "starves" any bacteria that may already be in the pits and fissures by depriving it of the food it needs to survive.

By creating a barrier against plaque and food, sealants are an extremely effective way to protect your child from tooth decay. In fact, sealants have been shown to reduce cavities by 70% compared to unsealed teeth!¹

Before sealant placement

After sealant placement

DOES THE PROCEDURE HURT?

Not at all. Sealing a tooth involves a quick, painless procedure that requires no numbing or cutting into the tooth. In fact, having sealants placed is one of the best ways to help preserve natural tooth structure. Talk to your dental professional if you have more questions about how the procedure is performed.

HOW LONG DO SEALANTS LAST?

Sealants generally last several years.² They are able to withstand normal chewing forces, and, as long as they remain intact, they protect the sealed pits and fissures from decay. During your regular dental visits, your dental professional will examine the condition of the sealants to ensure they are intact.

CAN YOU SEE THE SEALANT ONCE IT'S PLACED?

Sealants are designed to match the color of your teeth, making them virtually invisible. However, your dental professional will be able to see the sealant when you come in for your follow-up appointments to be sure it's still intact. In some cases, your dental professional may choose to use a sealant that glows when shined with a black light, making it even easier to check.

WHY ULTRASEAL XT SEALANTS?

Your dental professional has chosen to use UltraSeal XT sealants from Ultradent® because of their quality and ability to completely seal the tooth. The original UltraSeal XT sealant, UltraSeal XT plus has been the industry leader since 1998, taking home many top awards. And the all-new UltraSeal XT hydro gives your dental professional another option to provide long-lasting results.

Both UltraSeal XT sealants feature a consistency that makes them easy to place, which means your child spends less time in the dental chair. They also feature a formulation that keeps them intact much longer than other sealants. So you can be confident your child is getting the best treatment available.

CAN SEALANTS BENEFIT ADULTS?

Yes. UltraSeal XT sealants are especially beneficial because they offer the added benefit of releasing fluoride into the enamel, which improves the strength and cavity resistance of the tooth.

NOBODY LIKES CAVITIES

Cavities are no fun—especially for kids. Drilling can be scary for them. Not to mention costly and time consuming for you. Luckily, dental sealants like UltraSeal XT plus and UltraSeal XT hydro can help protect your child from cavities by preventing cavity-causing bacteria from getting to the hard-to-clean areas of the tooth.
